Subject: How to Fix Cement Creek Spill Fast

Dear Director McCarthy,

Use dynamite and bulldozers to quickly set up an earthen dam across Cement Creek downstream from the spill. There is plenty of local rock for boulders. Use this as a coffer dam to contain the spill while you set up an amazing filtration facility downstream.

I know the area of Cement Creek very well. There are numerous narrow, steep areas in national forest land where you can quickly establish an effective dam.

Don't dither. Don't "study the situation." Fix it, now. EPA needs to act fast to avoid totally discrediting itself, as your right wing enemies would love to see. This is the absolute worst time, when you are trying to get people on board with carbon dioxide controls.

The President lost face entirely when the Gulf oil spill went on and on, rather than going down with a device to pinch off the pipe immediately. Don't follow suit. Be decisive. You are the Federal government.

Best of luck,

a supporter

David Harrienger
